

Director's Report on Developmental Progress Assessment

Date of Visit: 23-07-2025

Child's Name: Aidel-Mohamed, Ilyan

Date of Birth: 07.01.2024

Age: 18 months

Gender: Male

Guardian: Mohammed

Assessment Overview:

Ilyan was assessed at our center for developmental evaluation. The child shows signs of developmental delays and information processing difficulties. However, based on the current assessment, Ilyan **does not score as a case of autism** at this stage. Given the young age and early signs of delay, it is too early to establish a definitive outcome. Continued monitoring is essential.

A reassessment is recommended within **3–4 months** to determine progress and whether the intervention is effective or needs to be adjusted.

Recommended Plan:

1. Development Protocol for Information Processing:

- Begin immediately and continue for 4 months.
- Reevaluate the child afterward, preferably in person.
- Establish a developmental baseline and adapt the plan as needed.
- Continue with the tailored intervention strategies focused on information processing.

Recommended Test through Neurazon (Canada):

- Please refer to their own assessment and report. These analyses are not done at EICADD.

Conclusion:

This assessment is not a final diagnosis but an early developmental evaluation. Ilyan is still at a stage where significant progress is possible with the right support and targeted intervention. A reassessment in 3–4 months is necessary to determine further steps.
