

Director's Report on Developmental Progress Assessment

Date of Visit: May 1st, 2025

Child's Name: Adel Ahmad Adel

Date of Birth: August 6th, 2014

Assessment:

Adel was assessed in person and presents with **information processing delays** and **white matter delays**, as confirmed by an MRI provided by his neurology team. These neurological findings are associated with **acquired intellectual developmental delays** and **features of autism**, although not indicative of classical autism. The child demonstrates potential for improvement and requires continued, targeted intervention.

Recommended Plan:

1) Development Non-Medicinal Protocol for Information Processing:

- Follow the protocol consistently for **4–6 months**
- Reevaluate the child **preferably in person**
- Establish a new developmental baseline based on observed progress
- Continue therapy without medicinal intervention

EICADD

2) Main Recommended Analysis (Neurazon, Canada):

- **Gut Intolerance Analysis – Neurazon (Canada)**
 - Sample: Hair
 - Purpose: Detailed evaluation of gastrointestinal intolerances
 - Timeline: **2 months business days** for results
 - Frequency: Repeated every 6–12 months
- **Precision Health Analysis – Neurazon (Canada)**
 - Sample: Saliva
 - Purpose: In-depth identification of underlying developmental contributors
 - Timeline: **4 months business days** for results
 - Frequency: Repeated every 6–12 months
- **Functional Urine Analysis Screening – Neurazon (Canada)**
 - Sample: Urine
 - Purpose: Analysis of critical biochemical and metabolic pathways
 - Timeline: **3 months business days** for results
 - Frequency: Repeated every 6–12 months

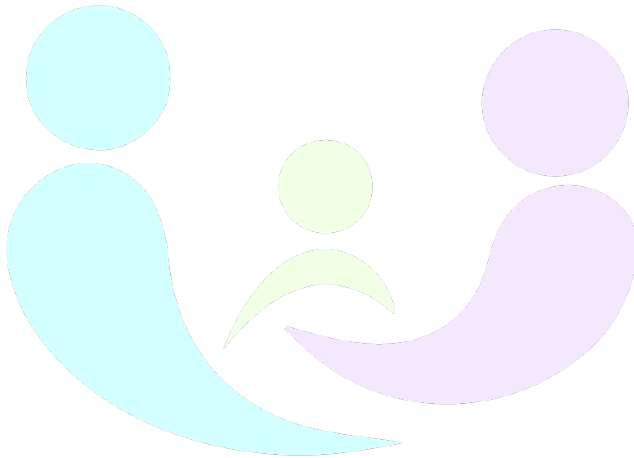

3) Recommended Therapy:

- **Rehabilitation Therapy in the Child's Home Country**
 - Therapy should focus on neuroplasticity, sensory processing, and cognitive rehabilitation
 - Close coordination with the child's care team is advised to align with the protocol and reassessment schedule

Conclusion:

This report reflects a **rehabilitation-oriented developmental assessment**, not a medical diagnosis. Adel has the capacity to improve significantly through structured therapy and follow-up testing. Continued monitoring and adherence to the protocol are essential for maximizing developmental outcomes.

This document is provided for **developmental assessment and planning purposes only** and does not serve as a final medical diagnosis as the child is capable of improving.
