

Director's Report on Developmental Progress Assessment

Date of Visit: 27-04-2025

Case Name: Ahmad Al Sarayrah

Date of Birth: 01-03-2010

Gender: Male

Guardian: Hussain

Assessment

Ahmad visited our center for a developmental progress evaluation on 27-04-2025.

The assessment revealed that the child has **improved greatly** following the first step of the protocol.

However, the child continues to present with:

- **Information Processing Delay**
- **Acquired features of Autism** attributed to an identified genetic variant.

This **evaluation** reflects the child's current developmental progress and is intended to guide further intervention planning. It is not a medical diagnosis. Ahmad shows strong potential for continued improvement under structured and consistent interventions.

Recommended Plan

EICADD

1) Development Protocol for Information Processing

- Continue targeted therapy sessions aimed at improving cognitive speed, executive functioning, and information integration.
- **Duration:** 3 months
- **Reevaluation:** After 3 months, preferably in person, to assess progress and adjust the intervention plan accordingly.
- **Goal:** Establish a new developmental and functional baseline based on measurable outcomes.

2) Recommended Tests (Based on the Next Evaluation)

- **Neuronal Growth Factors Absorption Analysis (through Neurazon – Canada):**
A detailed analysis to evaluate the absorption capacity of critical neuronal growth factors necessary for optimal brain development and synaptic function.
Sample: Hair
Turnaround Time: 2 months (business days)
Frequency: Recommended to be repeated every 6–12 months depending on clinical progress.

3) Recommended Therapy

- **Light Therapy:**
Targeted light exposure sessions intended to enhance neuronal activation, support mood regulation, and promote cognitive resilience and plasticity.

Follow-Up Plan

- **Reassessment:**
Scheduled after completing the current intervention protocol (approximately 3 months) to evaluate developmental gains and adjust therapeutic approaches as needed.
- **Monitoring:**
Continuous observation and feedback from therapy sessions, parental input, and behavioral responses will be documented to guide next-phase planning.
- **Important Note:**
This assessment provides a developmental framework for intervention and support planning and is not considered a definitive medical diagnosis. Ongoing improvements are expected with adherence to the recommended plan.
