

Ostathna – Developmental Progress Assessment Report

Date of Visit: 05-10-2025

Child's Name: Celena Malek Tashman

Date of Birth: 15-10-2011

Gender: Female

Guardian: Malek

Overview

Celena Malek Tashman was assessed by **Ostathna's team** on 05-10-2025.

The evaluation showed **information processing delays and global developmental delays** leading to **learning disability and academic delays**.

Previous neurological assessments indicated that Celena carries **variants linked to epileptic encephalopathy**, which contribute to her cognitive and developmental challenges. This highlights the importance of a coordinated approach between neurological care and developmental intervention.

Recommended Plan

1) Development Protocol for Information Processing

- Begin a structured **4-month developmental protocol** focusing on information-processing and learning readiness.
- **Reevaluate after 4 months**, preferably in person, to establish a baseline and measure progress.
- Adjust and continue the plan based on reassessment outcomes.

2) Recommended Tests

- **No further testing required at this stage.**
- Additional analyses may be advised if new clinical or developmental concerns arise.

3) Recommended Therapy (Ostathna Services)

- **Speech Therapy (ST):** 1–2 sessions per week
- **Occupational Therapy (OT):** 1–2 sessions per week
- **Plasticity Rehabilitation Therapy:** 1–2 sessions per week

Therapies should aim to improve speech-language comprehension and expression, sensory-motor integration, and neuroplasticity to enhance learning skills.

Conclusion

Celena shows significant **information-processing and learning delays** affected by underlying **epileptic encephalopathy-related variants**. With **consistent Ostathna therapy and close medical coordination**, she is expected to continue improving in communication, learning, and daily functioning.

Disclaimer

This report is valid for **4 months** from the assessment date.
It represents the child's current developmental profile and is **not a final diagnosis**. Progress and findings may change with continuous therapy, intervention, and neurological follow-up.

This report is valid for 4 months from the date of assessment.
