

Director's Report on Developmental Progress Assessment

Date of Visit: 29-04-2025

Case Name: Saddam Shadi Battikhi

Date of Birth: 13-04-2021

Gender: Male

Guardian: Maya Alfaluj

Assessment

Saddam was assessed in person at our center on 29-04-2025.

The evaluation findings revealed:

- **Information Processing Delays**
- **Intellectual Developmental Delays Features**
- **Acquired Features of Autism**

These developmental concerns suggest delays likely related to functional or physiological causes that require further investigation. Early symptoms indicate the need for a comprehensive intervention plan supported by additional precision testing. This report is intended for developmental and therapy planning purposes and does not represent a final medical diagnosis. Saddam shows potential for improvement with targeted multidisciplinary therapy.

Recommended Plan

1) Development Protocol for Information Processing

- Begin structured cognitive and sensory-motor intervention protocols focused on processing speed, language acquisition, and adaptive behavior.
- **Duration:** 4 months
- **Reevaluation:** In person after completion of the first therapy cycle to reassess developmental progress and establish a revised plan.
- **Goal:** Improve neural responsiveness, social interaction skills, and learning readiness.

2) Recommended Tests by Neurazon (Through Neurazon – Canada)

- **Precision Health Analysis:**
A comprehensive study to investigate underlying functional or genetic causes.
Sample: Saliva
Result Time: 4 months (business days)
- **Neuronal Growth Factors Absorption Analysis:**
Examines the body's ability to absorb and utilize growth factors essential for brain development and neuroplasticity.
Sample: Hair
Result Time: 2 months (business days)
Frequency: Repeat every 6–12 months
- **Gut Intolerance Analysis:**
Investigates food intolerance or gut dysfunction possibly affecting neurological and behavioral development.
Sample: Hair
Result Time: 2 months (business days)
Frequency: Repeat every 6–12 months

EICADD

3) Recommended Therapy

- **Speech Therapy (ST):**
2 sessions per week to target:
 - Language comprehension
 - Expressive communication
 - Social language and play skills
- **Occupational Therapy (OT):**
2 sessions per week focusing on:
 - Sensory processing
 - Motor coordination
 - Emotional regulation and independence

Follow-Up Plan

- **Reassessment:**
After 4 months of consistent therapy to track progress across developmental areas and adjust the plan accordingly.
- **Monitoring:**
Continued input from therapists, parent observations, and therapy session outcomes will guide therapy modifications and supplement integration if needed.
- **Note:**
This report does not constitute a final medical diagnosis but serves as a developmental and functional assessment for intervention design. Early and sustained therapy remains essential for improving Saddam's developmental trajectory.
