

## Director's Report on Developmental Progress Assessment

**Date of Visit:** 19-05-2025

**Child's Name:** Rahaf Elraibi

**Date of Birth:** 20-05-2022

**Age:** 3 years

**Gender:** Female

**Guardian:** Raghda

### Overview:

Rahaf Elraibi was assessed at our center for developmental concerns. The evaluation revealed notable **information processing delays** and **general developmental delays**, which have contributed to **acquired features of Autism Spectrum Disorder (ASD)**. These traits appear to be linked to a history of **recurrent and severe ear infections**, as well as other possible contributing factors that warrant further investigation.

This is not a definitive diagnosis of autism but rather an observation of traits acquired due to developmental and physiological disruptions. Further testing is essential to clarify the underlying causes and design a personalized intervention strategy.

### Recommended Plan:

#### 1) Development Protocol for Information Processing:

- Initiate a 4-month targeted intervention plan.
- Reassess the child in person after the 4-month period.
- Establish a baseline and monitor the effectiveness of therapy.
- Adjust the plan accordingly based on progress.

#### 2) Recommended Tests through Neurazon Canada:

To investigate the physiological and biochemical contributors to the current developmental profile:

- **Precision Health Analysis – Neurazon (Canada):**  
A comprehensive saliva-based test providing detailed insight into underlying causes.  
*Estimated processing time: 4 months (business days).*
- **Neuronal Growth Factors Absorption Analysis – Neurazon (Canada):**  
A hair-sample-based test that evaluates nutrient absorption and its effect on brain development.  
*Estimated processing time: 2 months (business days).*

### 3) Recommended Therapy:

- Begin a combined **Occupational and Speech Therapy Plan** to support sensory regulation, expressive/receptive language, and functional communication.
- **Light Therapy** is also recommended as a supportive intervention for 10 consecutive days to promote sensory and neural responsiveness.

### Conclusion:

This is a developmental assessment and not a final diagnosis. Rahaf is showing acquired developmental traits that may improve significantly with early and targeted intervention. Further testing and structured therapies are essential to support her developmental trajectory. The family is encouraged to proceed with the recommended steps and reassess in four months for progress evaluation.

#### Centers' Leading Staff:

**Speech Therapist:** Ms. Amira Alomari

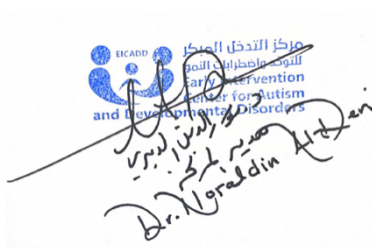

**Occupational Therapist:** Ms. Malak Jaber

**Psychologist and behaviour therapist (Ajman):** Ms. Asmaa Alshanawi

**EICADD Center Director**
