

### Developmental Progress Assessment Report

**Child's Name:** Ameer Mohammed

**Date of Birth:** 2020-06-04

**Date of Assessment:** 2025-03-04

### Assessment Summary:

Ameer was assessed in person and presents with clear signs of **information processing delays, developmental delays, and acquired features of autism**. While some behaviors overlap with the autism spectrum, the underlying developmental and neurological factors require further exploration. The current presentation does not yet constitute a final diagnosis, and deeper functional analysis is essential.

### Recommended Plan:

#### 1. Development Protocol for Information Processing:

- Continue protocol for **4 months**, then conduct a full reassessment (preferably in person)
- Monitor progress and establish a response-based baseline
- Modify the therapy plan according to progress

#### 2. Recommended Tests via Neurazon (Canada):

- **Precision Health Analysis**
  - Saliva sample
  - Estimated result time: **~4 months business days**
  - Aim: Identify underlying causes and contributing factors
- **Neuronal Growth Factors Absorption Analysis**
  - Hair sample
  - Estimated result time: **~2 months business days**
  - Aim: Evaluate nutritional and neurological absorption effectiveness
  - **Repeat every 6–12 months** as needed

#### 3. Recommended Therapy:

- **Rehabilitation Therapy in the home country** (speech, OT, or integrated plan)
- **Neuroplasticity Rehabilitation Therapy (UAE):** Focused on enhancing cognitive processing, neurological signaling, and developmental performance.

### Conclusion:

Ameer shows good potential for improvement. This assessment is **not a final diagnosis**, but rather a developmental evaluation. Continued intervention and proper testing are essential to track and support his development. Reassessment is strongly advised after 4 months.
